

MEDICAL CENTER

MEDICAL CENTER

The Medical Center module provides the means to manage health-related internal processes including medical tests, first aid treatments, emergency procedures, cost management and control, all with user-defined reporting. In larger organizations, the Medical Center module can be expanded to form the platform of the Employee Health Clinic - Medical Center and with further development become a full fledged hospital administrative application. The Medical Center acts as both a supplement to the Occupational Health and Safety module, as an operational module for the management of workplace health and safety programs and supporting the Training Management in events of i.e. skill rehabilitation and work-fitness licensing.
